

## **Presentation K-4**

### **The Effect of Cooling Water & Boiler Water Treatment Discharge Sources Upon Metal Finishing Wastewater Treatment Operations**

*Mark E. Andrus, TASKEM, Inc., Brooklyn Heights, OH*

A manufacturing facility involved in metal finishing may have many sources of water flow to the treatment plant. Among the most common sources of wastewater are boiler and cooling water discharges. Boiler and cooling water treatments have specific characteristics that can alter the standard hydroxide precipitation procedures of a metal finishing wastewater. This paper reports on the functional properties of boiler and cooling water treatments and how they can affect metal hydroxide wastewater treatment operations.
